

## Drug Interactions: Cytochrome P450 (CYP), P-glycoprotein, and More

This chart lists substrates, inhibitors, and inducers of several common cytochrome P450 isoenzymes and drug transporters. When using this chart, keep in mind that:

- It is prudent to use any combination with potential for interaction with caution (e.g., conservative dosing, appropriate monitoring), especially those involving drugs with a narrow therapeutic index and/or potentially serious dose-dependent side effects.
- **This table is not comprehensive.** See footnote b for some limitations to keep in mind.
  - For interactions with **HIV** or **hepatitis** antivirals, see the University of Liverpool drug interactions checker at <https://www.hiv-druginteractions.org/checker> (HIV) or <https://hep-druginteractions.org/checker> (hepatitis).
  - For interactions involving **dietary supplements**, see our Natmed Pro at <https://naturalmedicines.therapeuticresearch.com/>.
- Designation as a substrate, inhibitor, or inducer does not always mean that the interaction is of clinical significance.
- Many drugs impact multiple transporters **and** CYP450 isoenzymes. This interplay makes it challenging to predict clinical impact.
- A medication that interacts with one substrate of a particular pathway does not necessarily interact with all substrates of that pathway.
- A medication that is a substrate of an isoenzyme is not always an inhibitor of that isoenzyme.
- Drug metabolism is affected by genetics, age, nutrition, liver disease, hormones, and other endogenous chemicals.
- Additional influences on drug interactions include dosing (e.g., dose, timing, sequence, route of administration, duration of therapy), concomitant medications, pharmacodynamic interaction (e.g., gemfibrozil plus fluvastatin), specific drug features (e.g., therapeutic window, extraction ratio, side effect profile, multiple metabolic pathways), and phase II interactions (e.g., glucuronidation).

\*\*strong inhibitor ( $\geq 5$ -fold increase in exposure, or  $> 80\%$  decrease in clearance of substrate)

\*moderate inhibitor ( $\geq 2$  to  $< 5$ -fold increase in exposure, or 50% to 80% decrease in clearance of substrate).

- a. Product labeling or other evidence supports particular vigilance or proactive action to manage potential for clinically significant interactions involving this enzyme or transporter. Check product labeling of object and precipitant drug for specific guidance (e.g., **contraindications**, warnings, cautions, **dose adjustment**, and/or monitoring).
- b. **Limitations** of this chart: A medication might not be listed as a substrate of an enzyme that is a minor metabolic pathway for the medication, or if there is only in vitro or weak evidence of that isoenzyme's/transporter's potential for a clinically significant drug interaction involving the medication. In addition, drugs that are weak inhibitors or inducers of an enzyme/transporter might not be listed. Information about interactions, especially those involving substrates, is constantly evolving. Inhibition and induction potency is not well-defined for most medications.
- c. Acetaminophen: toxic metabolite is produced via CYP2E1; therefore, **induction** of CYP2E1 can increase toxicity risk.<sup>6</sup>
- d. Relies on this enzyme for conversion to active metabolites. Inhibition of this enzyme may reduce efficacy, whereas induction of this enzyme may increase efficacy and/or toxicity.
- e. A major CYP450 metabolic pathway.

**Abbreviations:** BCRP = breast cancer resistance protein; HIV = human immunodeficiency virus; inDUC = inducer; inHIB = inhibitor; MATE = multidrug and toxin extrusion protein; OAT = organic anion transporter; OATP = organic anion transporting polypeptide; OCT = organic cation transporter; P-gp = p-glycoprotein; SUB = substrate

### **Levels of Evidence**

In accordance with our goal of providing Evidence-Based information, we are citing the **LEVEL OF EVIDENCE** for the clinical recommendations we publish.

Level	Definition	Study Quality
<b>A</b>	Good-quality patient-oriented evidence.*	<ol style="list-style-type: none"> <li>1. High-quality randomized controlled trial (RCT)</li> <li>2. Systematic review (SR)/Meta-analysis of RCTs with consistent findings</li> <li>3. All-or-none study</li> </ol>
<b>B</b>	Inconsistent or limited-quality patient-oriented evidence.*	<ol style="list-style-type: none"> <li>1. Lower-quality RCT</li> <li>2. SR/Meta-analysis with low-quality clinical trials or of studies with inconsistent findings</li> <li>3. Cohort study</li> <li>4. Case control study</li> </ol>
<b>C</b>	Consensus; usual practice; expert opinion; disease-oriented evidence (e.g., physiologic or surrogate endpoints); case series for studies of diagnosis, treatment, prevention, or screening.	

**\*Outcomes that matter to patients** (e.g., morbidity, mortality, symptom improvement, quality of life).
